ROBUST ASYMPTOTIC INSURANCE-FINANCE ARBITRAGE

THORSTEN SCHMIDT

ABSTRACT. In most cases, insurance contracts are linked to the financial markets, such as through interest rates or equity-linked insurance products. To motivate an evaluation rule in these hybrid markets, [Artzner, Eisele, Schmidt, 2022] introduced the notion of insurance-finance arbitrage. We extend their setting by incorporating model uncertainty. To this end, we allow statistical uncertainty in the underlying dynamics to be represented by a set of priors $\mathcal{P}$. Within this framework we introduce the notion of robust asymptotic insurance-finance arbitrage and characterize the absence of such strategies in terms of the concept of $Q,\mathcal{P}$-evaluations. This is a nonlinear two-step evaluation which guarantees no robust asymptotic insurance-finance arbitrage. Moreover, the $Q,\mathcal{P}$-evaluation dominates all two-step evaluations as long as we agree on the set of priors $\mathcal{P}$ which shows that these two-step evaluations do not allow for robust asymptotic insurance-finance arbitrages.
